

## Solutions To Our Problem

Allow people to edit existing routes

People submitting their own routes

Use AI to learn from people's travel experience to get their preferred route

Recording routes just by people driving their preferred routes

## Design / Implementations

Will this be an add-on or a separate app?

Do we use the same design as other mapping apps?

Should we use buttons or roads to manually edit routes?

Should we lock the map so it does not move during editing?

## Hurdles In Implementing Our Solutions

Routes that people prefer might be actually blocked by construction or debris

Where to store the user modified routes? Locally or online?

People might submit terrible routes on purpose

Some maps cannot be accessed based on region

## Privacy / User Location

Only allow couple of roads near the destination to be changed

Making sure people's location and destination are repeated

Asking people to whether or not they want to share their routes

What about changes to routes from people's current location?

## Resources For Our Solution

Possibility use Streetview for guides

Use open alternatives to maps like OpenStreetMap

Using GPS to get people's position for selecting routes

Use routes from popular map apps like Apple or Google
