Problem Statement

While many transportation and map applications bring people to the correct place optimally, most of them do not usually use people's preferred route or entrance locally.

About The Problem

Most transportation and map applications do not account for external reasons that are not detours due to construction or high amounts of traffic. For example, a driver may want to enter a parking lot differently because of the placement of a card reader. Or a person may want to enter through a different entrance of a building without typing the exact address of the entrance of the building. A person should be able to change some local routes based on their preference.
